Abstract

An summary of all activities that are waste-generating. Today, there are more and more talks about recovery, recycling and the most faithful recovery of nature. The main commitments of the Ministry of Environment in the area of waste prevention and management include the implementation of the concept of "Life Cycle Analysis". Life-cycle assessment of products or services is an environmental management technique that identifies the material, energy and waste streams of a product throughout its life cycle and its impact on the environment. Thus, this paper aims to bring to the forefront a life cycle assessment approach in the management of an ecological waste disposal. Why should I make such an assessment? Because its objectives are: risk assessment, environmental performance assessment, environmental auditing and environmental impact assessment, as well as identifying possible changes that can be made at each phase of the life cycle and which can lead to environmental benefits and savings costs.

Keywords: waste management, ecological disposal, environmental management, life cycle, environment
